Chapter Outline

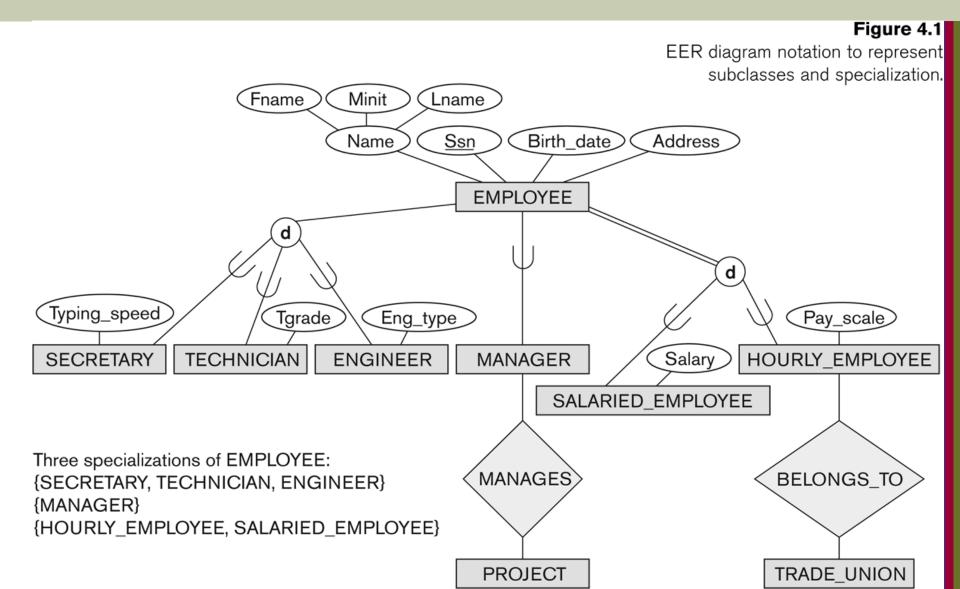

- EER stands for Enhanced ER or Extended ER
- EER Model Concepts
 - Includes all modeling concepts of basic ER
 - Additional concepts:
 - subclasses/superclasses
 - specialization/generalization
 - categories (UNION types)
 - attribute and relationship inheritance
 - These are fundamental to conceptual modeling
- The additional EER concepts are used to model applications more completely and more accurately
 - EER includes some object-oriented concepts, such as inheritance

Subclasses and Superclasses (1)

- EER diagrams Enhanced/Extended ER diagrams to represent these additional subgroupings, called subclasses or subtypes
- An entity type may have additional meaningful subgroupings of its entities
 - Example: EMPLOYEE may be further grouped into:
 - SECRETARY, ENGINEER, TECHNICIAN, …
 - Based on the EMPLOYEE's Job
 - MANAGER
 - EMPLOYEEs who are managers
 - SALARIED_EMPLOYEE, HOURLY_EMPLOYEE
 - Based on the EMPLOYEE's method of pay

Subclasses and Superclasses

Subclasses and Superclasses (2)

- Each of these subgroupings is a subset of EMPLOYEE entities
- Each is called a subclass of EMPLOYEE
- EMPLOYEE is the superclass for each of these subclasses
- These are called superclass/subclass relationships:
 - EMPLOYEE/SECRETARY
 - EMPLOYEE/TECHNICIAN
 - EMPLOYEE/MANAGER

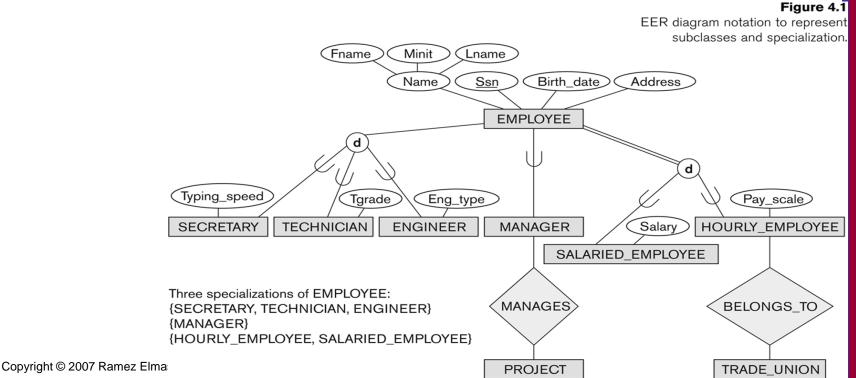

• • • •

Subclasses and Superclasses (3)

- These are also called IS-A relationships
 - SECRETARY IS-A EMPLOYEE, TECHNICIAN IS-A EMPLOYEE,
- Note: An entity that is member of a subclass represents the same real-world entity as some member of the superclass:
 - The subclass member is the same entity in a distinct specific role
 - An entity cannot exist in the database merely by being a member of a subclass; it must also be a member of the superclass
 - A member of the superclass can be optionally included as a member of any number of its subclasses

Subclasses and Superclasses (4)

- Examples:
 - A salaried employee who is also an engineer belongs to the two subclasses:
 - ENGINEER, and
 - SALARIED_EMPLOYEE

Subclasses and Superclasses (4)

- Examples:
 - A salaried employee who is also an engineering manager belongs to the three subclasses:
 - MANAGER,
 - ENGINEER, and
 - SALARIED EMPLOYEE
- It is not necessary that every entity in a superclass be a member of some subclass EER diagram notation to represent

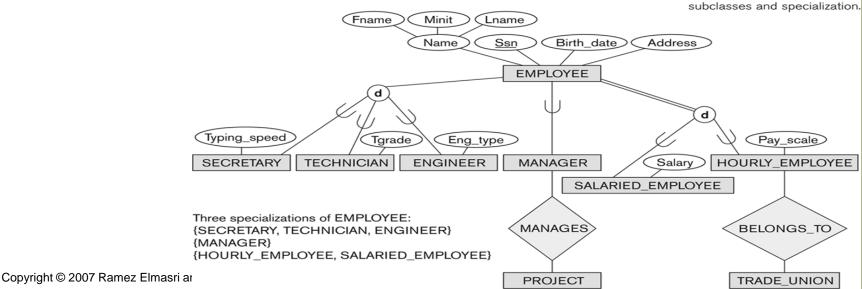

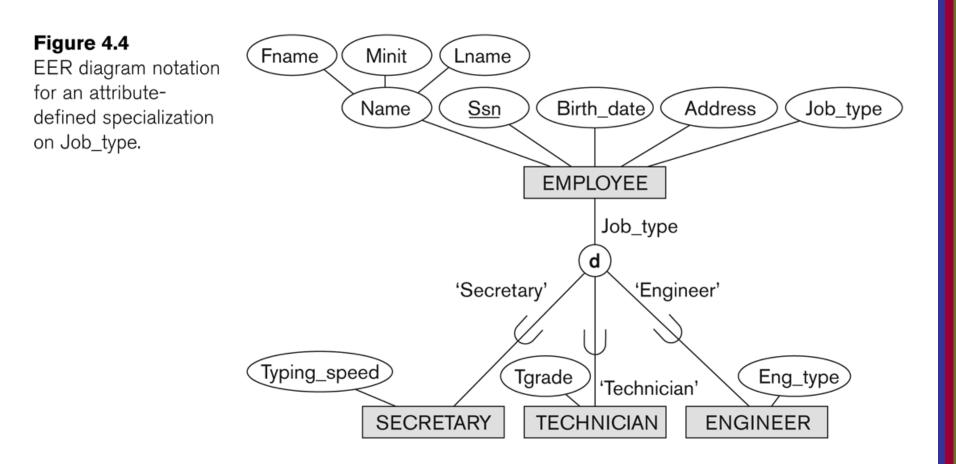

Figure 4.1

Specialization (1)

- Specialization is the process of defining a set of subclasses of a superclass
- The set of subclasses is based upon some distinguishing characteristics of the entities in the superclass
 - Example: {SECRETARY, ENGINEER, TECHNICIAN} is a specialization of EMPLOYEE based upon *job type*.
 - May have several specializations of the same superclass

Representing Specialization in EER Diagrams

Attribute Inheritance in Superclass / Subclass Relationships

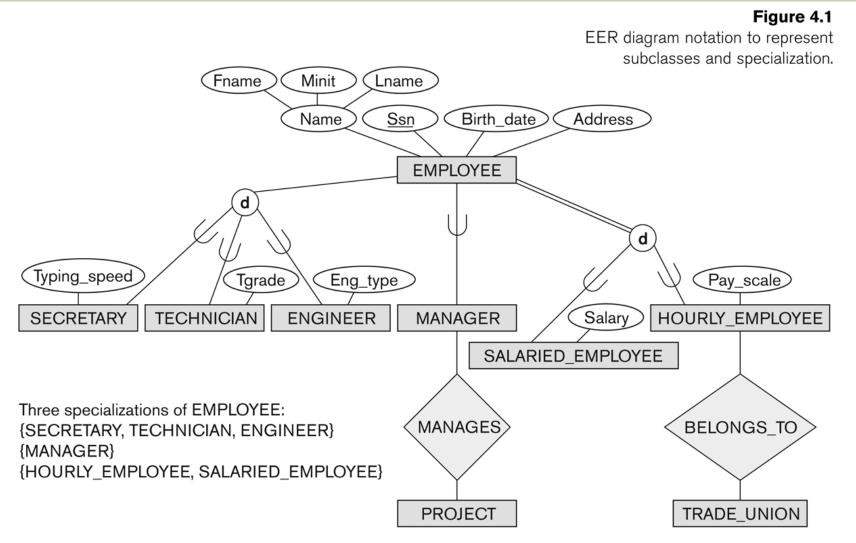

An entity that is member of a subclass inherits

- All attributes of the entity as a member of the superclass
- All relationships of the entity as a member of the superclass
- Example:
 - In the previous slide, SECRETARY (as well as TECHNICIAN and ENGINEER) inherit the attributes Name, SSN, ..., from EMPLOYEE
 - Every SECRETARY entity will have values for the inherited attributes

Specialization (2)

- Example: Another specialization of EMPLOYEE based on method of pay is {SALARIED_EMPLOYEE, HOURLY_EMPLOYEE}.
 - Superclass/subclass relationships and specialization can be diagrammatically represented in EER diagrams
 - Attributes of a subclass are called *specific* or *local* attributes.
 - For example, the attribute TypingSpeed of SECRETARY
 - The subclass can also participate in specific relationship types.
 - For example, a relationship BELONGS_TO of HOURLY_EMPLOYEE

Specialization (3)

Slide 4-14

Generalization

- Generalization is the reverse of the specialization process
- Several classes with common features are generalized into a superclass;
 - original classes become its subclasses
- Example: CAR, TRUCK generalized into VEHICLE;
 - both CAR, TRUCK become subclasses of the superclass VEHICLE.
 - We can view {CAR, TRUCK} as a specialization of VEHICLE
 - Alternatively, we can view VEHICLE as a generalization of CAR and TRUCK

Generalization (2)

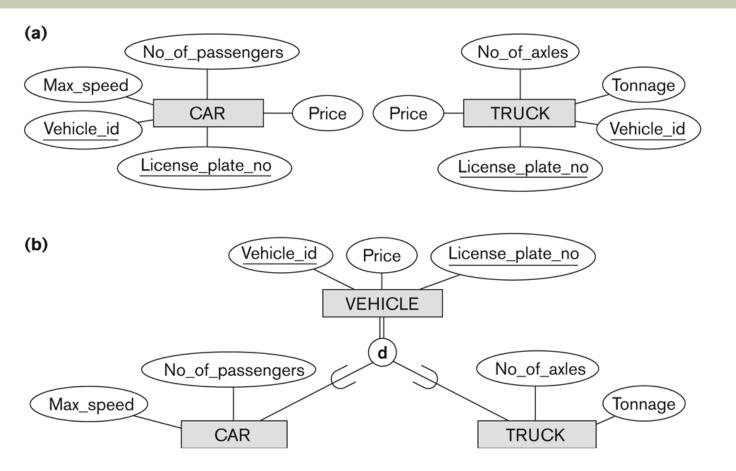

Figure 4.3

Generalization. (a) Two entity types, CAR and TRUCK. (b) Generalizing CAR and TRUCK into the superclass VEHICLE.

Slide 4- 16

Generalization and Specialization (1)

- Diagrammatic notation are sometimes used to distinguish between generalization and specialization
 - Arrow pointing to the generalized superclass represents a generalization
 - Arrows pointing to the specialized subclasses represent a specialization
 - We do not use this notation because it is often subjective as to which process is more appropriate for a particular situation
 - We advocate not drawing any arrows

Generalization and Specialization (2)

- Data Modeling with Specialization and Generalization
 - A superclass or subclass represents a collection (or set or grouping) of entities
 - It also represents a particular type of entity
 - Shown in rectangles in EER diagrams (as are entity types)
 - We can call all entity types (and their corresponding collections) *classes*, whether they are entity types, superclasses, or subclasses

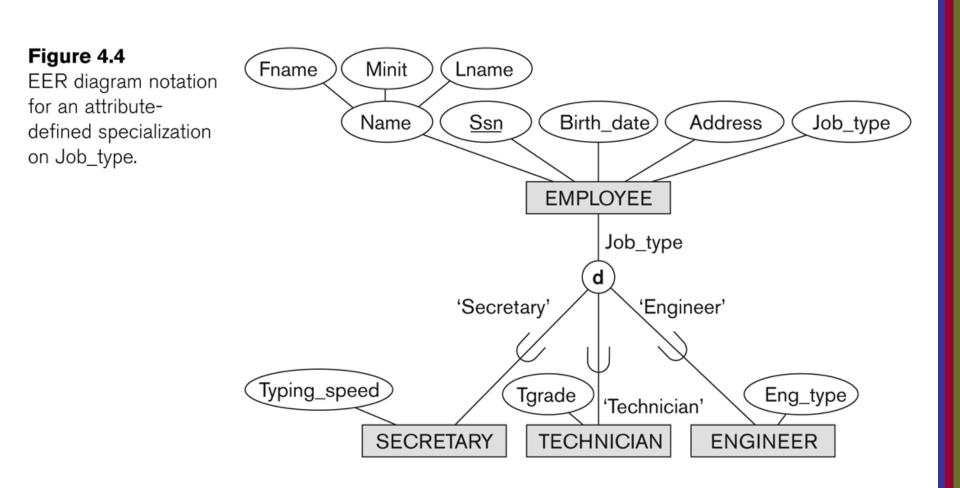

Constraints on Specialization and Generalization (1)

- If we can determine exactly those entities that will become members of each subclass by a condition, the subclasses are called predicatedefined (or condition-defined) subclasses
 - Condition is a constraint that determines subclass members
 - Display a predicate-defined subclass by writing the predicate condition next to the line attaching the subclass to its superclass

Constraints on Specialization and Generalization (2)

- If all subclasses in a specialization have membership condition on same attribute of the superclass, specialization is called an attribute-defined specialization
 - Attribute is called the defining attribute of the specialization
 - Example: JobType is the defining attribute of the specialization {SECRETARY, TECHNICIAN, ENGINEER} of EMPLOYEE
- If no condition determines membership, the subclass is called user-defined
 - Membership in a subclass is determined by the database users by applying an operation to add an entity to the subclass
 - Membership in the subclass is specified individually for each entity in the superclass by the user

Displaying an attribute-defined specialization in EER diagrams

Constraints on Specialization and Generalization (3)

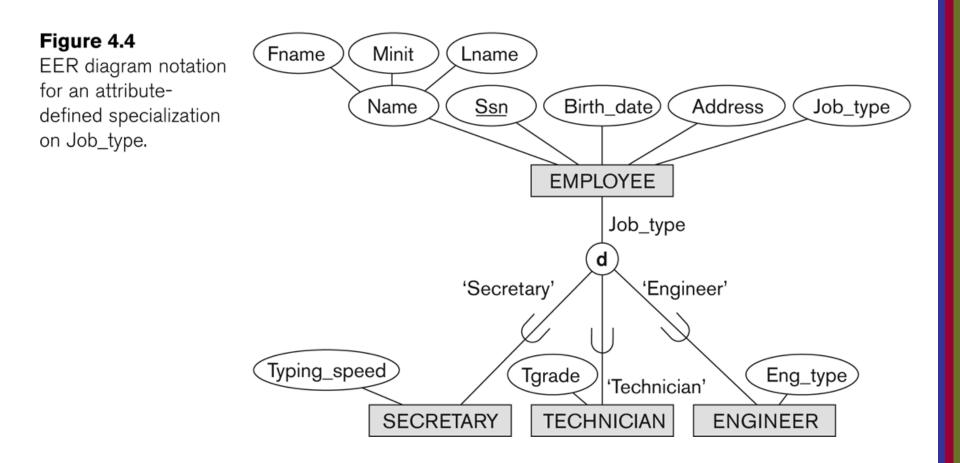

- Two basic constraints can apply to a specialization/generalization:
 - Disjointness Constraint:
 - Completeness Constraint:

Constraints on Specialization and Generalization (4)

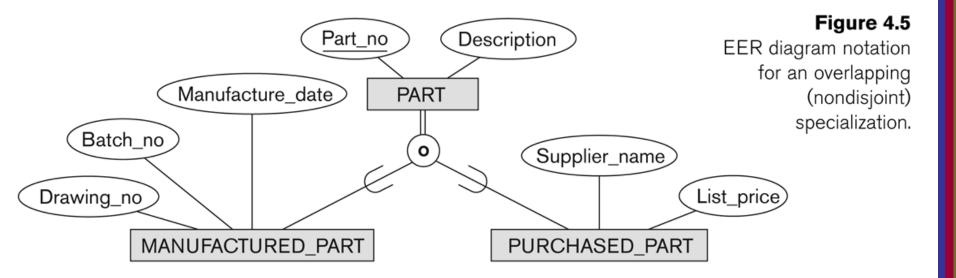

Disjointness Constraint:

- Specifies that the subclasses of the specialization must be *disjoint*:
 - an entity can be a member of at most one of the subclasses of the specialization
- Specified by <u>d</u> in EER diagram
- If not disjoint, specialization is overlapping:
 - that is the same entity may be a member of more than one subclass of the specialization
- Specified by <u>o</u> in EER diagram

Example of disjoint partial Specialization

Example of overlapping total Specialization

Constraints on Specialization and Generalization (5)

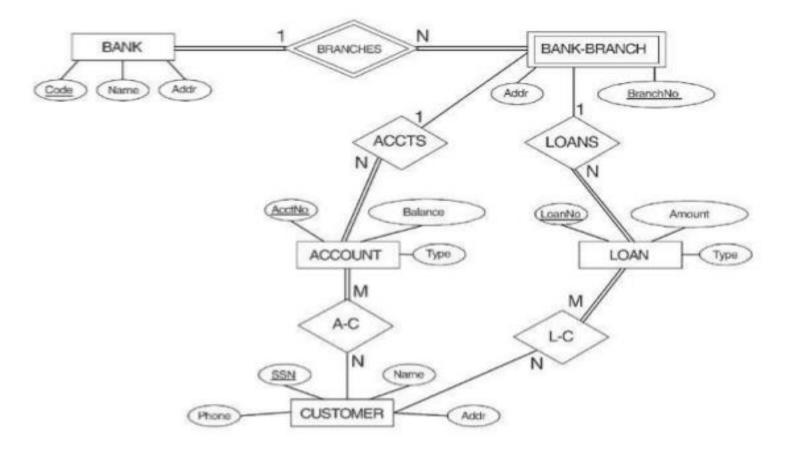

Completeness Constraint:

- Total specifies that every entity in the superclass must be a member of some subclass in the specialization/generalization
- Shown in EER diagrams by a <u>double line</u>
- Partial allows an entity not to belong to any of the subclasses
- Shown in EER diagrams by a <u>single line</u>

Constraints on Specialization and Generalization (6)

- Hence, we have four types of specialization/generalization:
 - Disjoint, total
 - Disjoint, partial
 - Overlapping, total
 - Overlapping, partial
- Note: Generalization usually is total because the superclass is derived from the subclasses.

Convert into EER ER DIAGRAM FOR A BANK DATABASE

Specialization/Generalization Hierarchies, Lattices & Shared Subclasses (1)

- A subclass may itself have further subclasses specified on it
 - forms a hierarchy or a lattice
- Hierarchy has a constraint that every subclass has only one superclass (called single inheritance); this is basically a tree structure
- In a *lattice*, a subclass can be subclass of more than one superclass (called *multiple inheritance*)

Shared Subclass "Engineering_Manager"

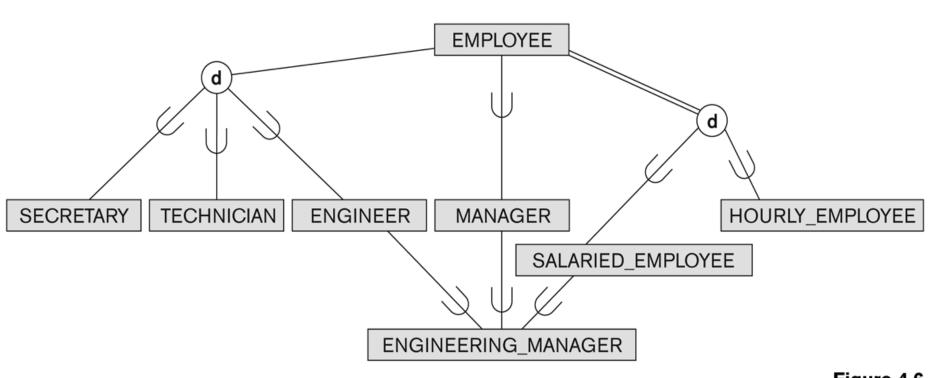

Figure 4.6

A specialization lattice with shared subclass ENGINEERING_MANAGER.

Specialization/Generalization Hierarchies, Lattices & Shared Subclasses (2)

- In a lattice or hierarchy, a subclass inherits attributes not only of its direct superclass, but also of all its predecessor superclasses
- A subclass with more than one superclass is called a shared subclass (multiple inheritance)
- Can have:
 - specialization hierarchies or lattices, or
 - generalization hierarchies or lattices,
 - depending on how they were derived

Specialization/Generalization Hierarchies, Lattices & Shared Subclasses (3)

- In specialization, start with an entity type and then define subclasses of the entity type by successive specialization
 - called a *top down* conceptual refinement process
- In generalization, start with many entity types and generalize those that have common properties
 - Called a *bottom up* conceptual synthesis process
- In practice, a combination of both processes is usually employed

Specialization / Generalization Lattice Example (UNIVERSITY)

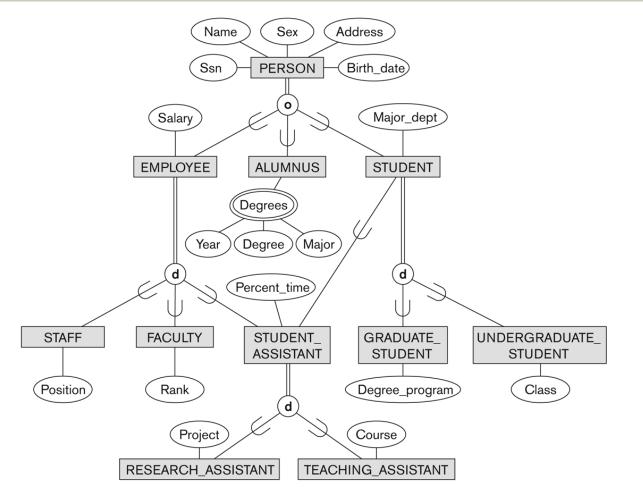

Figure 4.7

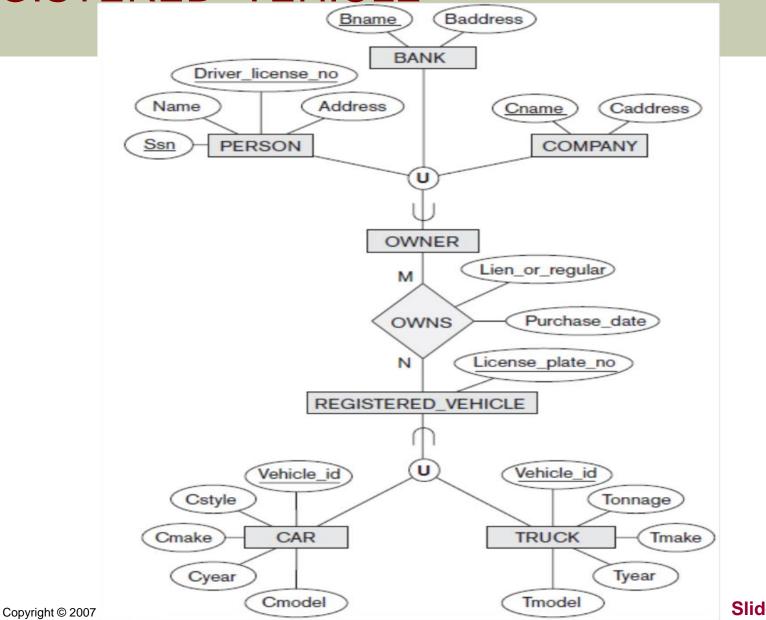

A specialization lattice with multiple inheritance for a UNIVERSITY database.

Slide 4- 33

Categories (UNION TYPES) (1)

- A shared subclass is a subclass in:
 - more than one distinct superclass/subclass relationships
 - shared subclass leads to multiple inheritance
- In some cases, we need to model a single superclass/subclass relationship with more than one superclass
- Superclasses can represent different entity types
- Such a subclass is called a category or UNION TYPE

Two categories (UNION types): OWNER, REGISTERED VEHICLE

Slide 4-35

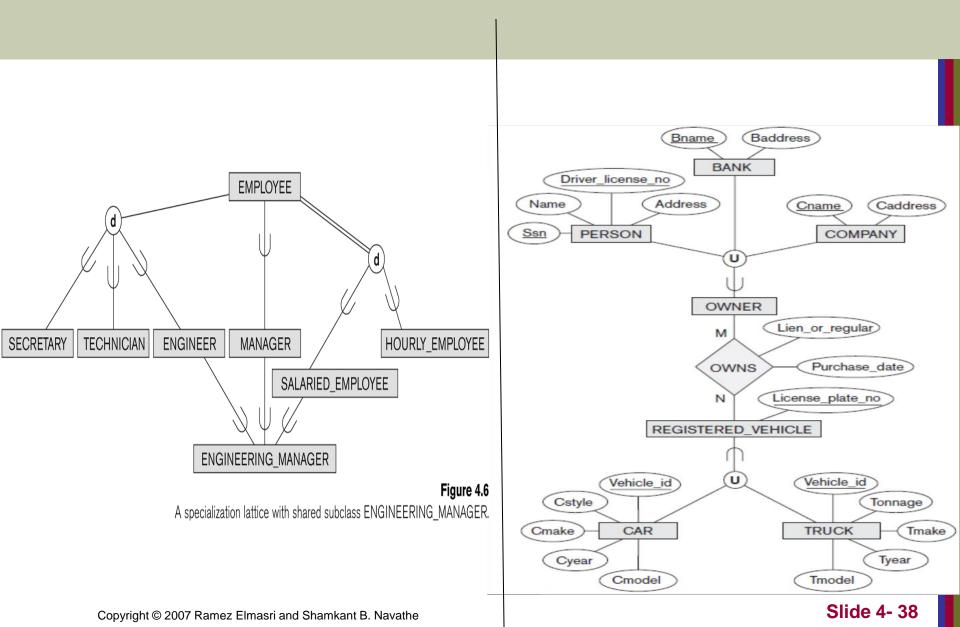

Categories (UNION TYPES) (2)

- Example: In a database for vehicle registration, a vehicle owner can be a PERSON, a BANK (holding a lien on a vehicle) or a COMPANY.
 - A category (UNION type) called OWNER is created to represent a subset of the *union* of the three superclasses COMPANY, BANK, and PERSON
 - A category member must exist in *only one of* its superclasses
- In shared subclass:
 - subset of the *intersection* of its superclasses
 - shared subclass member must exist in *all* of its superclasses

Union/Category(points)

- Inheritance in the case of categorisation corresponds to an entity inheriting only the attributes and relationships of that superclass it is a member of (selective inheritance)
- A categorisation can be total or partial
- Note: A total categorisation can also be represented as a specialization/generalisation

Difference between shared subclass and union

Aggregation

- One limitation of the E-R model is that it cannot express relationships among relationships
- Consider the ternary relationship proj_guide between an instructor, student and project
- Requirement: each instructor guiding a student on a project is required to file a monthly evaluation report.
 - create a quaternary (4-way) relationship set eval_for between instructor, student, project and evaluation.

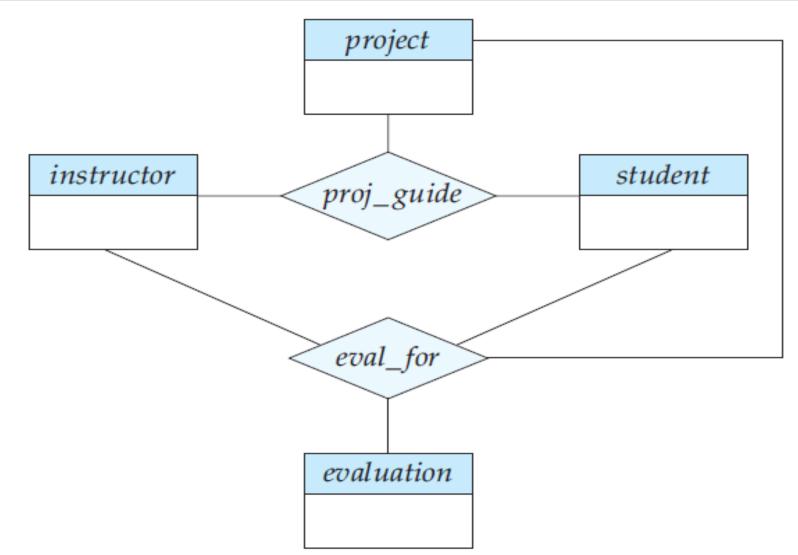

Figure 7.22 E-R diagram with redundant relationships.

- Relationship proj_guide and eval_for represent overlapping information
 - Every eval_for relationship corresponds to proj_guide
 - However, some proj_guide may not corresponds to any eval_for relationship
 - So we can't discard proj_guide relationship
- Eliminate this redundancy via aggregation

- Without introducing redundancy, the following diagram represents:
 - An instructor guiding a particular project to a particular student
 - An instructor, project, student combination may have an evaluation report
- Aggregation is an abstraction through which relationships are treated as higher-level entities
- Thus, for example, regard the relationship set proj_guide (relating the entity sets instructor, student, and project) as a higher-level entity set called proj_guide.

Aggregation Examples

Aggregation Example 2

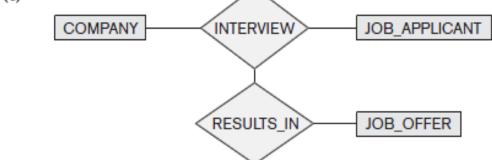

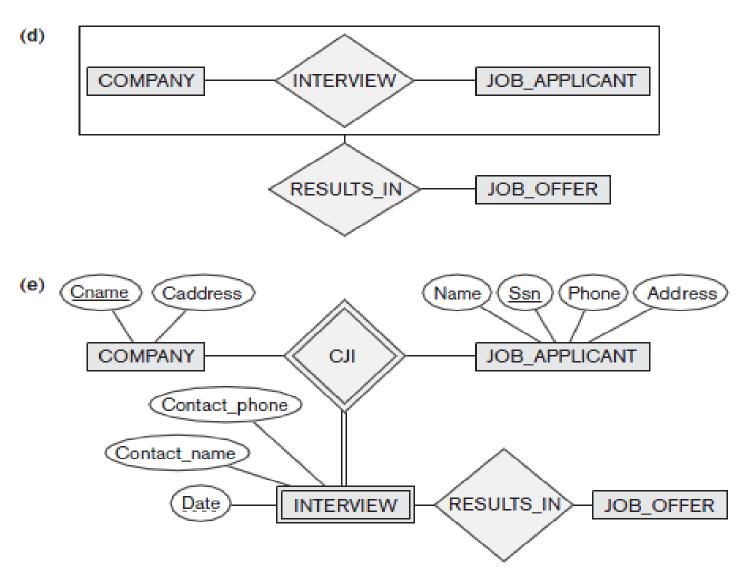

Figure 8.11

Aggregation. (a) The relationship type INTERVIEW. (b) Including JOB_OFFER in a ternary relationship type (incorrect). (c) Having the RESULTS_IN relationship participate in other relationships (not allowed in ER). (d) Using aggregation and a composite (molecular) object (generally not allowed in ER but allowed by some modeling tools). (e) Correct representation in ER.

Aggregation Example 2

Procedure to design an EER model:

- Identify the entity types
- Identify the relationship types and assert their degree
- Assert cardinality ratios and participation constraints
- Identify the attributes and assert whether they are simple/composite; single/multiple valued;
- Link each attribute type with an entity type or a relationship type
- Denote the key attribute type(s) of each entity type
- Identify weak entity types and their partial keys
- Apply abstractions such as generalisation/specialisation, categorisation and aggregation
- Assert the characteristics of each abstraction: disjoint/overlapping, total/partial
- Document semantics that cannot be represented in the (E)ER schema as separate "business rules"

Formal Definitions of EER Model (1)

- Class C:
 - A type of entity with a corresponding set of entities:
 - could be entity type, subclass, superclass, or category
- Note: The definition of *relationship type* in ER/EER should have 'entity type' replaced with 'class' to allow relationships among classes in general
- Subclass S is a class whose:
 - Type inherits all the attributes and relationship of a class C
 - Set of entities must always be a subset of the set of entities of the other class C
 - S ⊆ C
 - C is called the superclass of S
 - A superclass/subclass relationship exists between S and C

Formal Definitions of EER Model (2)

- Specialization Z: Z = {S1, S2,..., Sn} is a set of subclasses with same superclass G; hence, G/Si is a superclass relationship for i = 1,, n.
 - G is called a generalization of the subclasses {S1, S2,..., Sn}
 - Z is total if we always have:
 - S1 ∪ S2 ∪ ... ∪ Sn = G;
 - Otherwise, Z is partial.
 - Z is disjoint if we always have:
 - Si \cap S2 empty-set for i \neq j;
 - Otherwise, Z is overlapping.

Formal Definitions of EER Model (3)

- Subclass S of C is predicate defined if predicate (condition) p on attributes of C is used to specify membership in S;
 - that is, S = C[p], where C[p] is the set of entities in C that satisfy condition p
- A subclass not defined by a predicate is called userdefined
- Attribute-defined specialization: if a predicate A = ci (where A is an attribute of G and ci is a constant value from the domain of A) is used to specify membership in each subclass Si in Z
 - Note: If ci ≠ cj for i ≠ j, and A is single-valued, then the attribute-defined specialization will be disjoint.

Formal Definitions of EER Model (4)

- Category or UNION type T
 - A class that is a subset of the *union* of n defining superclasses
 - D1, D2,...Dn, n>1:
 - T ⊆ (D1 ∪ D2 ∪ … ∪ Dn)
 - Can have a predicate pi on the attributes of Di to specify entities of Di that are members of T.
 - If a predicate is specified on every Di: T = (D1[p1] ∪ D2[p2] ∪...∪ Dn[pn])

Alternative diagrammatic notations

- ER/EER diagrams are a specific notation for displaying the concepts of the model diagrammatically
- DB design tools use many alternative notations for the same or similar concepts
- One popular alternative notation uses UML class diagrams
- see next slides for UML class diagrams and other alternative notations

UML Example for Displaying Specialization / Generalization

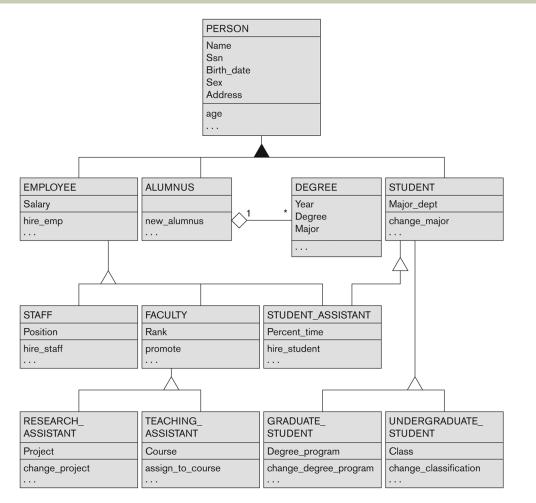

Figure 4.10

A UML class diagram corresponding to the EER diagram in Figure 4.7, illustrating UML notation for specialization/generalization.

Alternative Diagrammatic Notations

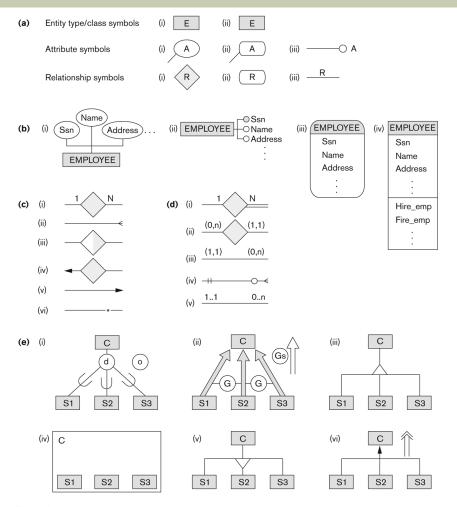

Figure A.1

Alternative notations. (a) Symbols for entity type/class, attribute, and relationship. (b) Displaying attributes. (c) Displaying cardinality ratios. (d) Various (min, max) notations. (e) Notations for displaying specialization/generalization.

General Conceptual Modeling Concepts

- GENERAL DATA ABSTRACTIONS
 - CLASSIFICATION and INSTANTIATION
 - AGGREGATION and ASSOCIATION (relationships)
 - GENERALIZATION and SPECIALIZATION
 - IDENTIFICATION
- CONSTRAINTS
 - CARDINALITY (Min and Max)
 - COVERAGE (Total vs. Partial, and Exclusive (disjoint) vs. Overlapping)
